3. BDD ensures that tests test the features which the requirements specify, but does not give the tester as much guidance on how to test these features as unit tests would, where you have a framework and very specific procedures to go through to derive test cases.
4. I think it hinders due to the number of files that must be maintained for testing, and the horrible nature of the error statements for tests.
5. It is self-documenting, but takes much more time to use and work with, making it impractical.
